Raspberry pi: Both camera and pi came in, OS successfully installed, wifi enabled, as well as terminal boot and use over SSH via SDNet. Easy setup, with mouse and keyboard. Need new 5V power source, because 700mA might not be able to power the camera.

Video Processing: Need an IDE for python. Most likely using openCV for python. For the design review, we will mostly do the video processing on a separate computer, and then load it onto the pi later.
